

The use of laminated hot melt adhesive film in the shoe material industry

Detail Introduction :

The traditional method of laminating shoe materials is naturally effective. Still, we also need to keep up with the trend of the times, innovate, find profits, and discover users' needs.

The use of universal glue to composite shoe materials fabric is possible, during the process is also quite simple, is the need for a lot of labor costs. At the same time, modern people pay more attention to environmental protection is not reflected, glue composite more or less some harmful substances to the human body exist, can not do environmental protection to maximize!

In recent years, people's demand for environmental protection has been getting higher and higher, and requirements for production efficiency are also getting higher and higher. Glue composite shoe fabrics gradually abandoned, replaced by hot melt adhesive film and hot melt mesh film to composite shoe fabrics.

Of course, compared to the previous glue, the cost of hot melt adhesive film and hot melt mesh film is higher. Still, the environmental protection needs are reflected. Hot melt adhesive film and hot melt mesh film do very well in environmental protection, using resin manufacturing production, almost no harmful components!

At the same time, the workers in the production plant are much more relaxed. They only need to operate the machine to complete hot melt adhesive film and hot melt mesh film. The hot melt adhesive film and hot melt mesh film are quickly bonded after high-temperature pressing, convenient and fast!

Because of these visible advantages, hot melt film is so popular and rapidly occupies the market!
