What Factors Need to Be Considered When Choos Hot Melt Adhesive Film

Detail Introduction:

What Factors Need to Be Considered When Choosing a Hot Melt Adhesive Film

What Factors Need to Be Considered When Choosing a Hot Melt Adhesive Film

The selection of hot melt adhesive film should carefully consider the following factors:

1. Color

Since the material to adhere to has specific requirements for colour, the colour requirements for the adhesive film should also be different. If there is no special requirement for the material's colour to a just use ordinary hot melt adhesive film.

2. Surface treatment of the material to be bonded.

For the surface treatment of the material to be bonded, the hot melt adhesive film is not as strict as adhesives, but the dust and oil stains on the contact surface should also be properly treated to achie better bonding effect.

3. Curing time

High bonding efficiency is the most important feature of hot melt adhesive film. Usually, the operation the hot melt adhesive film is about 15 seconds, but with the popularization of modern assembly lines machine speed is getting faster and faster, so the curing time of the hot melt adhesive film has also provided in the popularization of modern assembly lines machine speed is getting faster and faster, so the curing time of the hot melt adhesive film is retoriated about 5 seconds.

4. Temperature resistance

Hot melt adhesive films are very sensitive to temperature. As the temperature increases, the hot-mel adhesive film begins to soften. When the temperature is lower than the glass transition temperature adhesive film, the hot-melt adhesive film becomes brittle again. Therefore, the selection of the hot-melt adhesive film should fully consider the environment where the product is located—temperature chains. Initial tack and bond strength

All adhesives have the concept of initial tack, and hot melt adhesive films are no exception. Having a initial tack can keep the bonded objects in a relatively stable state at the beginning of contact. The bost strength of the hot melt adhesive film is related to the raw materials used in production and the mat the adherend. The material of the adherend is different, and the material of the hot melt adhesive fil

required should also be different; otherwise, it will affect the final bonding strength. It should be note initial tack and final bond strength are not much related; they are two different concepts.
